

Excel Learning Journey - Day 2 Premium Notes

SUMIF()

Used to calculate the sum of values that meet one condition. Syntax: =SUMIF(range, criteria, [sum_range]). Supports comparison operators (> < >= <= <> =) and dynamic criteria using cell references. Wildcards: * (zero or more characters), ? (exactly one character).

SUMIFS()

Used to calculate totals based on multiple conditions (AND logic). Syntax: =SUMIFS(sum_range, criteria_range1, criteria1, ...). Common business uses include sales, revenue and salary analysis.

IF()

Returns one value if a condition is TRUE and another if FALSE. Syntax: =IF(logical_test, value_if_true, value_if_false).

AND()

Returns TRUE only if every condition is TRUE. Frequently combined with IF() for business rules like bonus eligibility and loan approval.

OR()

Returns TRUE if at least one condition is TRUE. Used for discounts, eligibility rules, and login scenarios.

NOT()

Reverses a logical result. Example: =NOT(B2="Sales"). Commonly combined with IF() to identify records that do not satisfy a condition.

Combining Functions

IF+AND: Bonus eligibility. IF+OR: Priority customers. IF+NOT: Outside Sales vs Sales Team.

Common Mistakes

Use single-row references (A2, B2) inside AND/OR formulas and then fill down. Do not unnecessarily wrap NOT() in IF() when only TRUE/FALSE is required.

Interview Questions

Know the difference between IF vs SUMIF, SUMIF vs SUMIFS, AND vs OR, and the purpose of NOT().

Cheat Sheet

SUMIF: One condition. SUMIFS: Multiple conditions. IF: Decision. AND: All conditions. OR: Any condition. NOT: Reverse logical result.

Business Mindset

Always understand the business requirement first, then choose the appropriate function.
